

## Optimize your concrete delivery

The InLine dispatch is a Windows® based system to manage:

- Order entry
- Ticketing
- Scheduling
- Truck tracking
- Truck demand
- Efficiency reports
- Production reports
- Export to accounting

The perfect companion for the MPAQ TouchBatch Readymix system, the In-Line Dispatch is also compatible with all batching systems brands using the industry standard Universal Link interface.

### Straightforward

The In-Line user interface is clear and to the point. It is geared towards reducing the number of actions needed to get the job done.

This straightforward approach encourages the user to utilize all features of the software and in this way take advantage of the rich technology behind it. We focus on designing a capable and practical system, with all the features needed for effective day-to-day dispatching. Usability is an essential component of all our systems.

### Connected

In-Line uses a TCP/IP network and the U-Link standard protocol to send tickets to batch computers. This makes it fully compatible with all U-Link enabled batch systems in the industry.

In-Line can be configured as a central dispatch where all dispatching functions are handled from one building or as a distributed dispatch with user stations in each plant. It can also be setup as a hybrid, with a combined "central/local" configuration.

### Expandable

InLine is easy to upgrade and can be expanded to keep up with a growing operation, whether you need to add new trucks, new plants or additional users. Its modular design allows it to handle an operation with multiple plants as smoothly as a one plant operation.

Users can configure their station to interact with just one plant or with multiple plants.

At MPAQ we make complex tasks easier to handle

## Main Dispatch Office

### MPAQ In-Line Server

### User Stations

All programs and data reside on the server.  
Users can be anywhere on your network, at the main office or at the plants.

Bidirectional U-Link interface to batch PC's

Plants receive tickets from dispatch and send batch status back to dispatch.

### TouchBatch Control System

Dispatch Station (Optional)

Users at the plants can optionally log-in to the dispatch server and participate in dispatching tasks such as order entry and ticketing.

Live status data from truck units automatically updates the In-Line dispatch tracking screen in real time. The data is also logged for production and efficiency reports.

Trucks

## Enter orders, send tickets

- Enter orders with detailed delivery instructions.
- Assign mix designs, extra products, pricing and customer data when entering orders.
- Calculate concrete volume with built-in concrete calculator.
- View/print job location map.
- Schedule orders in advance for any day.
- Assign estimated times for travel, unloading and spacing between loads.
- Send tickets to each plant over the Internet.
- Dispatch an order to multiple plants and keep track of total delivered amounts for the order.

## Schedule, track and optimize

- Know in advance how many trucks are needed at any given time for each job and each plant.
- Explore "what-if" scenarios with job scheduling using interactive truck demand graphs.
- Follow the delivery stage of each truck in real time (with GPS truck units) or by estimated time (without GPS).
- Get reminders for loads that need to be dispatched.
- Easily reschedule a job to account for changes or delays.
- View, print or export production and efficiency reports.
- Track concrete volume per driver-hour.

- Print profit reports by job.
- Schedule start times for drivers.
- Record actual activity times for each driver.

## Observe, organize

- Watch delivery progress and status for all plants and trucks in real time, from any site with network access.
- Use project file to specify in advance all mix designs, extra products and pricing for each job.
- Link to your accounting software for next day invoicing.
